1. Introduction: sustainability management at universities

Many Higher Education Institutions (HEI) have been performing efforts in the implementation of sustainable development as a whole, and in their operations in particular, with the aim of reducing the environmental impacts of their operations. The literature has documented the various ways HEIs have been integrating sustainability in the different dimensions of their activities (e.g. Wals, 2014; Tilbury, 2012; Disterheft et al., 2013; Leal Filho, 2011; Leal Filho, 2012). Different approaches of how HEI are pursuing this topic have been identified (Lozano et al., 2013; Lambrechts et al., 2018). They can be classified in six many categories, as outlined in Table 1.

Despite the broad focus of sustainability at HEIs, two approaches seem to be more predominant in the recent literature, namely campus operations and institutional initiatives (Vaughter et al., 2013; Wals, 2014; Wals and Blewitt, 2010; Lambrechts et al., 2018). In this context, the term campus greening often refers to technical issues such as environmental management, sustainable buildings, renewable energies or carbon footprint and reporting. A “greener campus” or a more sustainable campus estate, characterised by improved energy and resource efficiency, is not only beneficial from an environment point of view, but can also deliver visible cost savings for institutions. There are investment costs, but these are usually amortised over time, when the cost-saving elements of the facilities start to be calculated. In addition,
such activities are important in enhancing student, staff and community experience and motivation (‘walk the talk, practice what you preach’). Universities as public institutions are often considered to be role-models (Verhulst and Lambrechts, 2015; Leal Filho et al., 2015), where more sustainable practices of, for instance, operation and procurement, can be tried out. At the same time, universities are privileged places for the transformation of consumption patterns and behavior (Schneidewind, 2014; Mulder, 2010). However, it seems that sustainable campus management is often narrowed to ecological issues, while the social dimension of sustainable development is often neglected. Although this is by far not a trivial matter, a broader approach would be desirable (Alshuwaikhat et al., 2008; Sonetti et al., 2016). The German university network HochN, for instance, refers among others to employment relationships, and controlling, communication, research operation.

- **Sustainable Buildings and Energy Management** involves the planning, establishment and maintenance of infrastructures with regard to sustainability criteria (Günther et al., 2018). This includes the planning of building in accordance with building sustainability schemes, and modernization of existing infrastructures (e.g. energy efficient lighting and HVAC2 systems, energy saving building insulations, building automation, on-campus energy generation systems)

- **Sustainable Procurement**: Universities develop strategies and guidelines to ensure that during the procurement of goods and services, sustainability criteria are routinely considered. Major product categories at universities are, for instance, office equipment and supplies, lighting, information and computer technology (servers, computer, monitors, notebooks) and sanitary infrastructure and equipment (hand drying systems, hygiene and cleaning articles). Accordingly, they should be environmentally and socially sound, low-waste, recycled or recyclable, made from renewable raw materials, energy-efficient, climate-neutral, fair, regionally or biologically produced, and transported and traded over least possible distances.

- **Waste Management** at universities includes avoidance and reduction, collection, segregation, handling and disposal of mainly solid but also liquid waste, and even hazardous waste (Günther et al., 2018). Major waste streams are office waste (i.e. paper, folders, laminated papers, stationeries and other writing materials, toner and cartridges, batteries, etc.), waste electrical equipment (IT, cables), furniture (desks, chairs, office cabinets), laboratory or clinical waste (chemicals, equipment, wastewater), construction and demolition waste, food waste from cafeterias and general waste from bins all over the campus which may have the character of municipal waste, but also includes plastic bottles or cans or tetra packs (Espinosa et al., 2008).

- **Sustainable Mobility** at universities comprehends at least three aspects: internal transports and own vehicle fleet, business travel and commuting of staff and students. By far, business travel especially overseas or to remote destinations dominates GHG emissions from mobility (for instance 44% of all mobility GHG2 emissions at the TU Dresden, 37% account for air travel, see Günther et al., 2018). Business travel is a good example of a dilemma situation because international cooperation and mutual exchange at academic conferences are essential for HEI.

While campus greening is sometimes considered being a first step towards a sustainable university, it is a complex endeavor that faces many challenges (Leal Filho et al., 2017). In order to be effective, it is necessary to embed all activities in an institutionalized framework, be it sustainability management system or a task force or other suitable strategies (Ferrer-Balas et al., 2009; Spira et al., 2013; Baker-Shelley et al., 2017; Leal Filho et al., 2018).

Although a transformation to a more sustainable university cannot be forced, among other issues also due to the premise of academic freedom, it is argued, that a whole-institution approach is essential (Moore et al., 2005, Mader et al., 2013; Lozano et al. 2013, 2015; Lozano, 2006; Littledyke et al., 2013; Hoover and Harder, 2015). The whole institution approach and the attempt to make SD an integral part of research, teaching, and operation needs to be accompanied by transformative environments, organizational learning practices and effective leadership for sustainability (Mader et al., 2013). The participation and inclusion of staff and students are considered as crucial and the “Green Office Model” represent an auspicious approach.

Green Offices can play an important role in addressing the issue of sustainable development at universities. However, only few studies have investigated the effectiveness and advantages of green offices and related institutions. The purpose of this study is therefore provides an overview of how Green Offices and similar governance structures can assist to improve sustainability performance of higher education institutions. More specifically, the objective of this study was to survey members of administrative staff and researchers with interest in sustainability about their perceptions regarding the aspects considered in Green Offices, their advantages but also their limitations and challenges during implementation. By doing so, the paper contributes to the body of literature in the broad field of education for sustainability and provides insights also for practitioners.

The paper is structured as follows: Based on a general literature review on sustainability management at universities, the second section provides a description of the Green Office and Sustainability Office Model. The third section describes methods applied in particular the items of the questionnaire and the sampling

2. The Green Office Model and the Sustainability Office Model

Across universities, the two modalities of offices are predominant and are therefore explored on this paper. A Sustainability Office acts as a node, from where all sustainability related activities are coordinated. They not only involve campus operations, but also research and teaching on matters related to sustainable development.

A Green Office on the other hand, can be defined as a university sustainability platform, usually led by students, that empowers them—and to a lesser extent research staff—to embed sustainability in the curriculum, operations, community and governance. The contrasts among them are also clear: student-led sustainability initiatives are often limited, as they lack funding and institutional access. Staff-led initiatives often struggle to engage students and mobilise teaching staff and researchers to act on sustainability. Unlike traditional sustainability initiatives which tends to focus on academic staff, a formally set Green Office empowers students to lead on sustainability and usually receives funding, mandate and office space from university management (rootAbility and Leuphana University, 2019).

For the purposes of clarity and consistency, this paper will from now on refer to “Green Offices” or “Green Offices and similar settings” meaning that both categories are covered.

Building on previous work in Adompfent et al. (2019), Fig. 1 positions the Green Office Model in comparison to established sustainability initiatives by the student community and the university. The figure shows two different dimensions of the model: One distinction is made between policy making, determining the strategic direction of sustainability efforts and project execution, implementing the policy decisions. Another distinction is made between the student community as the community of students attending the university and the university, including its staff, teaching, research and operations.

A sustainability student group takes the role of executing projects within the student community. Its purpose is for students to increase awareness around sustainability issues among other students. In some cases, a sustainability student group will also lobby towards changes being made by the university. The team consists of only students. As such it provides strong student leadership, but virtually no staff involvement. It operates largely without funding and has to rely on students volunteering their time. In some instances, it may receive minor project funding, if there is strong student-staff collaboration (Spira, 2012).

By contrast, a sustainability minded-student representative co-creates policy within the realm of the student community (Wals and Jickling, 2009). In some countries, such as Germany, there is a system of the student community self-governing, with an elected government (“ASTA”), which has the right to tax students and freely use those funds. In England, the National Students' Union plays a similar role and has over the years engaged on a variety of sustainability-related initiatives.

In other cases, student self-governance may be less developed, but student bodies and unions are generally able to allocate and deploy funds and launch projects within the students' community (Bergan, 2004; Chamlee-Wright, 2015; Klemenic, 2012). Beyond this primary task of self-governance, the student representation may lobby for other changes to be made by the university. Among the student representatives, there may be sustainability committee members or representatives personally advocating for sustainability. The representatives volunteer their time or receive a small compensation for their work. They may have funds from the general student government or union budget available for sustainability projects. Such student representatives may also be invited into official university committees as advisors or voting members.

A staff-led sustainability team or coordinator—typical of a Sustainability Office—may exist to advance sustainability within the university as a whole. Their primary task is to perform planning and execute projects, but they may also support sustainability committee members and working groups in policy making or take this role if there is no policy forum for sustainability. The teams at Sustainability Office provide for strong staff leadership, but not always count on a strong student involvement. Universities with Sustainability Offices usually allocate them, a working budget, office space and a clear mandate (Appleton, 2017).

A sustainability committee establishes the strategic and policy framework for sustainability efforts of a university. Its role is to recommend policies and projects, which are then implemented by other bodies. It will also coordinate actions between actors and monitor and report on progress. The membership of such committees may be diverse. It will generally include university staff and management, as well as students. The committee will either possess a formal mandate from the university or will be recognized tacitly as a legitimate actor through practice (Appleton, 2017).

The Green Office Model cuts across these divisions of student community and the university, and of policy and execution, to create a sustainability platform that empowers students and staff to embed sustainability in the curriculum, research, operations, community and governance. It creates a bridge between the student community and the university in policy execution, through its team of students and staff jointly implementing projects (Spira and Baker-Shelley, 2015). It may also be active in policy-making by writing policies or reports itself or in collaboration with a sustainability committee. The set-up of the teams allows for strong student and strong staff leadership and a good integration within the university. Green Offices are also given a working budget, staff, office space and a mandate (rootAbility and Leuphana University, 2019).

The Green Office or similar models are the most popular means of collaboration but there are other forms of cooperation between the student community and universities (Drupp et al., 2012; Kerr and Hart-Steffes, 2012; Winston, 2013), which may be theme based or timely restricted.

Operationally, collaborations in the realm of policy may take the form of open meetings or assemblies that allow students and staff equally to give input into a university’s sustainability efforts.
(Netzwerk, 2018). Depending on the country and university, students may also be represented in formal governing bodies such as the university or faculty councils, programme committees or faculty boards. These may then also have a role in co-shaping sustainability policies. Alternatively, students can be formal members of sustainability committees or working groups. If students are given sufficient influence in such a committee and the committee has sufficient influence within the university, this may provide a similar level of student leadership in policy matters.

Despite the clear usefulness and proven effectiveness of governance structures such as Green or Sustainability Offices, their use is not as wide as it could—or should-be. Also, there is a limited amount of empirical international work performed to date, which have investigated the various barriers related to their works. On the basis of the need to address this research gap, this paper aims to present the results of an international study on Green and Sustainability Offices and identify the extent to which these structures being deployed, specific aspects of their operations and main barriers related to their activities.

3. Methodology

An international survey was used in order to collect responses from a wide audience of universities. The main idea of this survey was to discuss main aspects of Green or Sustainability Offices at universities as well as challenges and advantages of their establishment. An interesting approach of this survey is that it was not solely dedicated to universities which already have these offices—but also to those who do not have one, but can benefit from the results presented here.

The questionnaire was designed and shared through the online application Google Forms. It contained a set of questions to identify the extent to which Green Offices or similar governance structures are being deployed round the world, some specific aspects of their operations and the barriers related to their activities. Table 2 summarizes the topics/questions presented in the survey.

The questionnaire was initially pre-tested at the authors’ universities in order to check and evaluate survey questions. As a next step, the online survey was sent to the network of universities of the Inter-University Sustainable Development Research Programme (IUSDRP) which groups worldwide academic staff with an interest in sustainable development research and its ramifications. With around 120 member universities distributed in all continents, this network represents a selected group of higher education institutions engaged in sustainability issues. The respondents are researchers in these universities, possessing suitable know-how on campus sustainability and their operational practices. The survey remained open for two months and contained closed-ended questions and one open-ended question where the respondents include additional comments about their experiences.

After data collection, the survey information was analysed by means of simple descriptive statistics, i.e. percentages to describe frequency distributions of answers. Content analysis was used to categorise the qualitative data from the open-ended question.

4. Results and discussion

In this section the results of the survey will be presented and described in a detailed way. Implications of the research will be discussed. The first set of questions (i.e. questions 1 to 5) aimed at a compilation of general characteristics of the universities from which staff members filled out the questionnaire.

The majority of the respondents (n = 70) are from Germany, the Netherlands, Belgium and Brazil (all in all 55%), while other countries are represented with lower shares (n < 4, i.e. Albania, Cameroon, Guatemala, India, Iran, Italy, Lithuania, Malta, Portugal, Serbia, Spain, Switzerland, United Kingdom and the Unites States). Most of the universities are rather large (i.e. 43% with more than 20,000 students, 14% of universities with up to 5,000 students), cover a variety of subjects (72,5%) and are public universities (72.9%). About one third of the universities represented in the sample are private (27,1%), and one third of the universities (27.5%) are specific in the focus, which means that they are technical universities, universities of applied sciences or liberal art colleges. 56% of the universities in the sample have been founded after 1950.

The questionnaire was different for the group of respondents from universities with and without Green Offices or similar structures (i.e. group A: with Green/Sustainability Offices, group B: without these offices). Surprisingly, in most of the universities in the sample, a green office or similar are in place (67.1%), mainly over a period of more than 2 years (i.e. 46.8% between 2 and 5 years, and 17% with experience more than 5 years).

Universities with Green Offices or similar structures have been asked about rather general characteristics (i.e. questions 7–10). In one third of the universities in group A, supposedly the larger ones, more than 5 persons are employed (31.9%), while the majority of offices is equipped with 2–5 persons (59.8%) or have one single person responsible (8.5%). In many cases the employees are from staff and students (61.7%). In just under 90% of the surveyed universities, students have the chance to volunteer in the office (89.4%). Student participation is a major feature of the Green Office Model (rootAbility and Leuphana University, 2019; Spira and Baker-Sherley, 2015). However, it seems that there is until now no common understanding of the term Green Office. The term might be used to describe in institutionalization of sustainability management at universities in general and/or to relate to other formal or informal forms of the cooperation with students.

In the next section, the respondents from group A are surveyed about their appraisals and positions towards the characteristics, effectiveness and obstacles.

More than 50% of respondents indicate that the following aspects are considered in the scope of the activities of their office: waste management, sustainability campaigns and specific actions with regard to SDGs, as well as extracurricular education for sustainability and energy efficiency (Fig. 2). Well over 40% of the respondents state that their offices deal with sustainability reporting and sustainable mobility/transportation (each 48.9%). Other areas considered in the present offices are: campus and campus community gardens (both with 46.8%), water management (44.7%) and sustainable procurement (42.6%). About one third of the respondents confirmed extracurricular sustainable education as a working field of their Green Office (31.7%).

Many other examples for activities have been provided by different single respondents (n = 1), such as, for example more sustainable catering, protection of green spaces, integration in existing lectures and the responsibility for keeping the campus environmental license (i.e. the certification of the EMS). From the responses it can be seen that the working area of Green Offices or similar structures are rather diverse and not limited to single topics. They include but are not limited to the integration and participation of students within campaigns and other motivational instruments such as campus community gardens. On the other hand, there are aspects that can only be treated in close cooperation with
university staff, such as management of waste, water and energy, mobility, and reporting.

The following set of questions also had predefined (default) response categories (i.e. nominal scale) which could be selected by the respondents. Multiple answers were permitted and under the category “other” free answers could be given. In the analysis, the answers have been categorized with regard to the percentages of consents to a default answer (i.e. selecting an answer). When more than 50% of the respondents selected a specific default answer, a high degree of approval is supposed (i.e. the majority of respondents). A frequency distribution between 49% and 20%, is interpreted as a medial approval by the respondents. Multiple answers were permitted and under the category “other” free answers could be given. In the analysis, the answers have been categorized with regard to the percentages of consents to a default answer (i.e. selecting an answer). When more than 50% of the respondents selected a specific default answer, a high degree of approval is supposed (i.e. the majority of respondents). A frequency distribution between 49% and 20%, is interpreted as a medial approval by the respondents. Lower percentages occurred mainly in the category “others” and related often to meaningful other options, i.e. advantages, barriers and responsibilities of the offices.

The respondents have been split into two groups, i.e. group A (with Green Office or similar) and group B (without these offices). The questions for the groups were slightly different (i.e. “which are advantages” and “which would be advantages”) and surveyed attitudes, positions and expectations towards the (a) perceived and selected advantages of the offices work and (b) the perceived and selected barriers towards their implementation. Advantages of having a Green Office or similar structure (see Fig. 3).

The majority on both groups (i.e. with or without an office), felt or expect that the main advantage of having a structure like that lies in awareness raising by making the efforts with regard to

The following set of questions also had predefined (default) response categories (i.e. nominal scale) which could be selected by the respondents. Multiple answers were permitted and under the category “other” free answers could be given. In the analysis, the answers have been categorized with regard to the percentages of consents to a default answer (i.e. selecting an answer). When more than 50% of the respondents selected a specific default answer, a high degree of approval is supposed (i.e. the majority of respondents). A frequency distribution between 49% and 20%, is interpreted as a medial approval by the respondents. Lower percentages occurred mainly in the category “others” and related often to meaningful other options, i.e. advantages, barriers and responsibilities of the offices.

The respondents have been split into two groups, i.e. group A (with Green Office or similar) and group B (without these offices). The questions for the groups were slightly different (i.e. “which are advantages” and “which would be advantages”) and surveyed attitudes, positions and expectations towards the (a) perceived and selected advantages of the offices work and (b) the perceived and selected barriers towards their implementation. Advantages of having a Green Office or similar structure (see Fig. 3).

The majority on both groups (i.e. with or without an office), felt or expect that the main advantage of having a structure like that lies in awareness raising by making the efforts with regard to
campus sustainability more visible. By doing so, participants have stated that the offices can promote a sense of sustainable leadership, mobilize and integrate students and staff. More than 40% of the respondents indicated that Green Offices or similar bring together different aspects of sustainability into one (central administrative) facility. The offices are also considered to promote curriculum greening. Significant differences (about 10%) between the two groups occur with regard to the expectations related to leadership and the integration of activities to one responsible administrative unit. Respondents from universities with the offices state the leadership effect as being more important (in terms of percentages). The share of respondents seeing an advantage in the clustering of actions into one facility is lower in this group. This might be an indication that the expectation is not fully met in universities with such offices.

In the category “other”, single respondents (group A) stated that their university offices helped promote sustainability issues in operations, created sustainable start-up initiatives and contributed to holding the administration accountable. Also it was indicated, that a bridge between students and staff was built and, presumably in terms of outreach, sustainable communities have been formed. Expectations in group B are rather high: the offices are expected to transform universities, promote sustainability across curricula and allow for associations with external partners. An important finding of the survey is that universities might generally benefit from the implementation of Green Offices or similar structures mainly in the field of leadership, promotion and mobilization of students. Other works have suggested instruments for enhanced student participation (Disterheft et al., 2015).

When asked about the main barriers for the implementation of the offices (see Fig. 4), the lack of funding and lack of support from administrations were frequently selected by the respondents in both groups (more than 40%). Lack of interest from staff as well as lacking materials/resources and expertise are evaluated the same range in percentage in both groups (between 30 and 48%). The groups differ in the perception of the aspect of interest from students, where in the group with established offices, this is considered as challenge by 36.2% and only by 13% in the other group. With regard to the support by administration, the situation is different. Here, the respondents in group B consider lacking support as more relevant (60.9%) than the respondents from universities with existing offices (48.9%). Single respondents from group A suggested further challenges with regard, for example, to difficulties to reach and engage students and to the problem that offices may create a parallel structure which is not connected to “real” operational procedures. It was also stated that institutional bureaucracy is seen as challenge. No significantly different challenges have been stated by respondents from group B. The major obstacles for Green Offices or similar structures is lack of funding and lack of support by the university administration, which is in line with previous studies. It has been stated that, for example, administrative and systemic sluggishness and hence time lacks in terms of decision making are important obstacles (Velazquez et al., 2005). It has been stated in other studies, that administration and management were under the

![Fig. 3. Answers referring to advantages of having a green office or similar (group A with Green Office n = 47, group B without Green Office n = 23).b) Challenges against implementation of a Green Office or similar structure.](image)

![Fig. 4. Answers referring to challenges against implementation of a Green Office or similar.](image)
greatest obstacles (Leal Filho et al., 2017). It was not surprising and known from other studies that lack of financial resources and budget restrictions led to significant barriers for the implementation of sustainability management in general (Brandli et al., 2015; Dahle and Neumayer, 2001; Lozano, 2006).

Finally, two questions were offered for group B (without Green Offices or similar) and asked for personal opinions (attitudes) towards the implementation of such offices and the main actors in the establishment. It turned out from the answers, that a majority (59.1%) of the respondents consider it important to establish a sustainability office (to a great or moderate extent, i.e. 59.1% and 22.7%), while only a minority sees these aspects only to a small extent (18.2%). No respondent selected the ‘not at all’ option.

The space for additional comments resulted in important discussion topics. According to the content analysis of the provided answers, five main topics were collected and could be related to the literature, as presented in Table 3.

These issues, along with the descriptive data gathered from closed-ended questions, represent good additions to the literature by sharing operational aspects and the main barriers that should be overcome. This information is useful for both universities which already have Green or Sustainability offices and those which are considering to engage on that topic, since important advantages and aspects that should be taken into consideration were discussed in order to maximise to potential benefits of these workplaces.

5. Conclusions

This paper has shown that Green Offices and similar governance structures may assist efforts within higher education institutions to work in the field of sustainable development. It has outlined the fact that the set-up of such offices can be an effective tool in supporting the implementation of sustainability initiatives on campuses, and in fostering awareness among students and staff on matters related to sustainable development. However, despite their usefulness, their work has a variety of constraints, which can be political (e.g. lack of support), financial (e.g. lack of resources) or in respect of lack of materials and limitations of expertise. Lack of interest plays, albeit to a lesser extent, a role among the barriers.

There are differences between the modus operandi of Green Offices, Sustainability Offices and other infra-structures. These will be examined in a different paper, which will explore the specific features of Green Offices only, and assess the extent to which they contribute to institutional efforts to promote sustainability.

This paper has some limitations. One of the them is the fact that there were no interviews to complement the on-line data collection. This would prove challenging, bearing in mind the size and the wide geographical distribution of the sample. Also, a limitation was found in respect of the possible bias based on who the respondents were. The IUSDRP database contains researchers, but not support or technical staff, so the details obtained are related to the actual level of knowledge of these respondents. But since they are all sustainability researchers, it is fair to assume they are informed on what is happening at their institutions. Due to the rather small sample, this study if of qualitative and explorative character.

The implications of the paper are two-fold. Firstly, it outlines the usefulness of Green Offices and similar governance structures as elements which may concretely support the institutional efforts of HEIs in pursuing and implementing sustainability goals. Secondly, the paper has identified some of the key obstacles for the realization of sustainability objectives at the institutional level, among others the lack of specific funding and lack of support from the administrations. This suggests that greater efforts are needed to persuade management to allocate more resources to Green Offices and other similar sustainability infra-structures. Hence, the paper contributes to the academic literature in the field of education for sustainable development and sustainability management at universities. The study is a valuable contribution to the more practitioner-oriented discourse on the effectiveness and challenges of green offices. Also, by applying descriptive statistics and qualitative content analysis of the open questions, new information is provided, which was not previously available in this field.

</table>
| Endorsement    | - Importance of having green activities endorsed in a bottom-up approach – although a good consensus with top-down approaches eventually facilitates these activities;  
                 - Green Offices or similar should be considered specific organisational units within universities and therefore have their legal regulation;  
                 - As a complement of the last topic, these units should also have their own budget in order to help developing plan of actions.                                                               | Spira (2012)                                                                               |
|                |                                                                                                                                                                                                                   | Appleton (2017)                                                                            |
| Real commitment| - Universities need to be really committed to the creation of sustainable change and it therefore needs to be a strategic aim;  
                 - Universities need to see themselves more as part of the society and engage in their role to sustainability;  
                 - Just having a “Green Office” might not be enough – special caution needs to be taken into consideration in order to avoid greenwashing.                                             | Spira and Baker-Shelley (2015)                                                            |
| Teaching       | - Universities should teach more about achieving sustained and holistic progress towards a more sustainable university (from energy consumption and waste reduction to more crucial topics such as teaching students to successfully challenge existing market-focused paradigms and policies and create sustainable practices in their future careers). | Netzwerk (2018)                                                                            |
|                |                                                                                                                                                                                                                   | Green Office Wageningen (2018)                                                           |
| Staff          | - Staff is fundamental to create continuity; it helps guarantee more innovation and more yearly projects;  
                 - Student involvement seems to be partial in some offices but others have plans to include them in the office committee in the future.                                                                 | rootAbility and Leuphana University (2019)                                                   |
| Activities     | - It may be a challenge to find a balance between running yearly projects and initiating new innovative ones;  
                 - Recently established offices might have many plans and slightly struggle in building up structures, developing concrete actions and choosing their main focus.                             | Otto von Guericke Universität Magdeburg (2019)                                               |
